

inode-based File System

- What is a file?(P5)

inode: 7 software layers

The Naming Layers of the UNIX FS(P10)

L1: Block Layer(P11)

- Super Block(P12)
- Block size: a trade-off & bitmap(P14)

L2: File Layer(P15)

- inode for Larger Files(P16-17)

L3: inode Number Layer(P18)

L4: File Name Layer(P20)

- LOOKUP in a Directory(P21)

L5: Path Name Layer(P22)

- Links(P23-25)
- Renaming(P27-28)

L6: Absolute Path Name Layer(P28)

An Example: Find Blocks of "/programs/pong.c"(P29-38)

Directly Dump a Directory(P40)

L7: Symbolic Link Layer (P41)

- Two Types of Links (Synonyms)(P43)
- Sidebar: Notice the Context Change(P44-45)

Implementing the file system API

- File Meta-data -- inode(P10)

OPEN & read a File(P11)

- File Descriptor(P12)
- Why File Descriptor?(P13)
- File Cursor(P14)
- fd_table & file_table(P15-16)
- OPEN Implementation(P17)
- READ Implementation(P18)

At the Head of a Disk Partition(P20)

File Open & Read Timeline(P22)

File Creation Timeline(P23)

WRITE, APPEND & CLOSE(P24)

- SYNC(P26)
- Delete after OPEN but before CLOSE(P27)

Other file systems (not inode)(P33-38)
